説明

The natural energy resources indicated in the present invention mainly include wind energy, sea wave energy and solar energy. Conversion and application of these energy resources can only be valuably applicable when they are in a state of high energy. The existing conversion devices for such as hydroelectric generation, wind power generation and solar power generation, make a direct conversion into electrical power in a state of high energy. There is no efficient conversion and application for medium/low energy. In fact, most of the natural energy resources belong to medium/low energy. Thus, the present invention provides an energy accumulation method for medium/low energy resources, allowing the medium/low energy of natural energy resources to be accumulated to high energy for valuable application (such as hydroelectric generation). The method of the present invention completely put in use of natural energy resources, so that the operation cost is very low and there is no environmental pollution, thereby tally with the present requirement of environmental protection and local economic development. Furthermore, the area in which the present invention is put into practice can be developed into a sightseeing area based upon the characteristics of the facility.
